FILTER UNITS FOR WOODWASTE MK RANGE

The process could not be simpler for the collection of chipboard, MDF, sawdust and wood chippings.

All these units are fitted with powerful, self-cleaning fans to transport the waste material through a ductwork system into the unit for separation.

On entering the unit the bulk waste spins into polythene bags and the finer dust is filtered through the highglaze terylene needlefelt media to allow the air to return to the working area without heat loss.

Each unit is fitted with Inventair special swirl baffles which maximises even bag filling.
The units are supplied with their own D.O.L starter and spare polybags

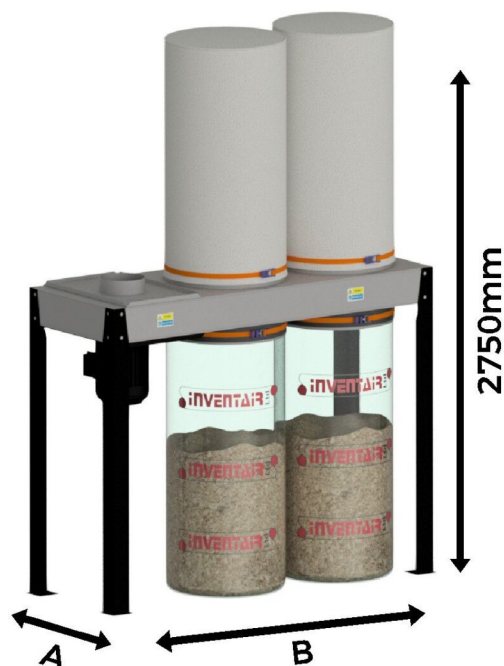

Dust & Fume Engineering • Quality Fabrications

Features

Simple Design
Unique Swirl Baffles
Quick Connection Filters
Robust Manufacture

Visit our online store to purchase all of your extraction unit spares.
